

## Prescription

This course provides the student with an introduction to communication systems focusing on the physical layer of the OSI model. It covers both analog and digital modulation techniques, including baseband and passband signaling. Topics include matched filter receivers for additive noise channels and associated error rate performance, intersymbol interference and Nyquist pulse shaping. Also covered are fundamentals of wireless fading channels, an overview of synchronization and a brief introduction to advanced techniques such as MIMO, OFDM and CDMA.

## Course learning objectives

Students who pass this course should be able to:

1. describe various analogue and digital modulation techniques, including their relative merits (BE graduate attribute 3(a))
2. design receivers to mitigate the effects of noise and interference of bandlimited channels (BE graduate attributes 3(a),3(c))
3. describe wireless propagation channels models and simulate them using Matlab (BE graduate attributes 3(a),3(c))
4. design Monte Carlo Matlab simulations to evaluate the performance of wireless systems (BE graduate attributes 3(d),3(f))
